Duality

For every primal feasible $x \in \mathbb{R}^n$ and dual feasible y, weak duality gives $c^\top x \geq b^\top y$, and the gap $\sqrt{\sum_i (x_i - y_i)^2}$ closes at an optimum. The tableau

$$T = \left(\begin{array}{ccc|c} 1 & 0 & -2 & 4 \\ 0 & 1 & 3 & 5 \\ 0 & 0 & 1 & 6 \end{array} \right), \qquad \left\{ \sum_{j=1}^{n} a_{ij} x_j \leq b_i \right\}$$

is optimal when every reduced cost is non-negative. Complementary slackness requires $x_j \big(c_j - \sum_i a_{ij} y_i\big) = 0$ for every j, and the ratio test picks $\min_i \{ b_i / a_{ij} : a_{ij} > 0 \}$. Integrals such as

$$\int_0^\infty e^{-\lambda t}\, dt = \frac{1}{\lambda}, \qquad \left\| \frac{\partial f}{\partial x} \right\| \leq \sqrt{\frac{L}{\mu}}$$

appear in the convergence analysis. Each line of ordinary text in this paragraph should select as a tight band around its own glyphs, without the highlight of one line covering the letters of the line above or below it, even though the extension font draws delimiters three ems tall.
